Development Plan Guidance on Air Quality and Co-location		

Scotland's 4th National Planning Framework has recently been published. This document is therefore being reviewed and updated to reflect the new policies. You can still find useful and relevant information here but be aware that some parts may be out of date and our responses to planning applications may not match the information set out here.

### Why we comment on this issue

Strategic and local development plans have an important role to play in protecting and improving air quality in Scotland. Environmental Protection UK (2011) [guidance for local authorities on integrating air quality and climate change policy](#) suggests that in order for climate change and air quality strategies to implement the full range of actions they propose, they need to influence other plans and strategies that guide a local authority's services. Development plans provide an important opportunity to address air quality through supporting sustainable transport infrastructure, the location of new development, promoting sustainable places and green infrastructure

In 1995, the Environment Act set out the legal requirement for ministers to "prepare and publish a statement...referred to as 'the strategy' containing policies with respect to the assessment or management of the quality of air". The Scottish Government develops domestic policies and initiatives to improve air quality and reduce risks to human health.

SEPA and the Scottish Government work in partnership with the other devolved administrations and the Department for Environment, Food and Rural Affairs to ensure objectives set out in the [Air Quality Strategy for England, Scotland, Wales and Northern Ireland](#) are achieved and that transposition and implementation of European Community (EC) and other international obligations are taken forward. There is a statutory duty on SEPA to have regard to the strategy in carrying out its pollution control functions. We are a statutory consultee for all review and assessment reports and action plans.

### SEPA's planning objectives for this topic

- To ensure that development plans aim to minimise carbon and local air quality emissions and recognise the links between the two agendas;
- To ensure that development plans make an effective contribution towards protecting and improving air quality in the plan area;
- To ensure that plan allocations are located, sited and designed to minimise impacts of adjacent regulated processes; and,
- To ensure that development proposals do not create unacceptable risks to adjacent communities.

### How we will address this issue through Strategic Environmental Assessment

- Require SEA to consider the effects of policies, proposals and allocations on air quality
- Recommend that SEA objectives used for assessment include objectives to maintain and improve air quality including improving air quality, reducing emissions / levels of air pollution, reducing levels of nuisance (odour, dust, etc)

### Links with other development plan topic tables

Other related tables include: sustainable resource use (SPACE tool, zero waste, district heating and renewable energy).

The following table outlines our requirements and recommendations for Strategic and Local Development Plans relating to air quality and co-location in more detail. If the following requirements are not met then we are likely to make formal representations to the emerging development plan.

Further details on the implementation of the requirements and recommendations and supporting information can be found in the Air Quality and Co-location Background Paper.

Development Plan Guidance on Air Quality and Co-location		

- Consideration of other pertinent issues such as co-location of sensitive land uses with sources of emissions; and,
  - Promoting renewable energy and low carbon options that do not have a detrimental impact on local air quality.
3. The link is made between improving air quality and reducing greenhouse gas emissions and highlights the need for green house gas reduction measures not to have a detrimental impact on air quality.
3. When developing the spatial strategy and resulting allocations consideration is given to the impacts of alternative options and sites on air quality and greenhouse gas emissions by:
- Minimising potential negative impacts and seeking to maximise potential positive impacts in AQMAs and areas at risk of becoming an AQMA;
  - Use of carbon assessment tools such as SPACE;
  - Consideration of other pertinent issues such as co-location of sensitive land uses with sources of emissions; and,
  - Promoting renewable energy and low carbon energy options that do not have a detrimental impact on local air quality.
4. Site allocations are informed by information regarding any adjacent regulated processes with relevant development requirements being attached as required. We also recommend that the planning authority consult with the operator of the regulated site to ascertain the impact that development proposals at an adjacent site could have on the existing business.
