## 1. Introduction

This chapter summarises:

- the process used to designate water bodies as heavily modified or artificial;
- SEPA's assessment of the condition of these water bodies;
- the environmental objectives that we have set for them.

Some surface water bodies have been substantially altered in character for purposes such as navigation, power generation, public water supply provision, recreation, land drainage and other important human sustainable development activities.

The alterations to the water bodies' physical characteristics may have been caused by:

- direct engineering modifications to the structure and condition of the bodies' beds, banks and shores or morphological characteristics (eg engineered concrete flood defence walls, etc);
- substantial changes to water flows and levels (eg the disruption of water flows and levels caused by large dams) that have consequent impacts on the structure and condition of the beds, banks and shores of water bodies.

Where their physical characteristics cannot be restored without significant adverse impacts on the uses served by the alterations or on the wider environment, SEPA has identified the water bodies for designation as heavily modified.

The ecological quality of heavily modified water bodies (HMWBs) is described by their "ecological potential". This is a measure of how the ecological quality of such a water body compares with the maximum quality achievable without significant adverse impacts on:

- the purposes served by the physical alterations (eg flood defence or hydropower generation);
- the wider environment.

The ecological potential of a HMWB may be maximum, good, moderate, poor or bad (see Section 3).

Water bodies have been designated as artificial water bodies (AWBs) if they were created where no water body previously existed (eg most canals and some reservoirs). As for HMWBs, the ecological quality of artifical water bodies (AWB)s is described by their ecological potential.

Except where so doing is technically infeasible or disproportionately expensive, the objective for a HMWB or AWB that is not at maximum or good ecological potential is to achieve good ecological potential by 2015. Longer timescales, for example by 2021 or 2027, may be set if improvement is possible but it is technically infeasible or disproportionately expensive to do by 2015.

## 2. Designation of heavily modified or artificial water bodies

To identify water bodies for designation as HMWBs and AWBs, SEPA has followed the general approach to designating such water bodies set out in European guidance<sup>1</sup>. Information on the conditions required for designation and the criteria used by SEPA to assess whether those conditions are met can be found in Appendix A. Figure 1 below outlines the designation process.

As part of the initial characterisation of the Scotland RBD, which was completed in 2004<sup>2</sup>, SEPA identified a number of water bodies as provisional HMWBs or AWBs. These water bodies were screened to identify those that clearly met the conditions for designation as HMWBs or AWBs. The method used to do this followed guidance<sup>3</sup> issued by the UK Technical Advisory Group (UKTAG).<sup>4</sup>

Additional HMWBs have subsequently been identified by SEPA as it has gathered further information on the status of bodies of surface water and the pressures on them.

Summary information on all water bodies that have been designated as HMWBs or AWBs is given in Tables 1 and 2 below. If you want information about a particular water body, please use the interactive map on SEPA's website at: www.sepa.org.uk/water/river\_basin\_planning.aspx

Note:

Some water bodies are identified as heavily modified water bodies for more than one purpose and are consequently counted more than once in Table 1.

#### Classification of heavily modified and artificial water bodies 3.

The process used by SEPA to assess the ecological potential of heavily modified and artificial water bodies is set out in the Scotland River Basin District (Classification of Water Bodies) Directions 20095.

The process is based on the methodology recommended by UKTAG<sup>6</sup> and described in guidance prepared under the Common Implementation Strategy for the Water Framework Directive7.

The detailed criteria used by SEPA to enable the classification of large numbers of HMWBs and AWBs to be completed for inclusion in this plan are set out in the UKTAG methodology or in Table A1 in Appendix A available on the SEPA website at: www.sepa.org.uk/water/river basin planning.aspx

Information on the extent to which the impacts of water bodies' heavily modified or artificial characteristics have been mitigated was provided by water users and other interested parties at a series of workshops organised by SEPA. This process is described in Annex 2: Consultation and engagement, available online at: www.sepa.org.uk/water/river\_basin\_planning.aspx

As further information is gathered about the water bodies concerned, understanding of the ecological potential they can achieve will improve. Such improvements in understanding will be taken into account in future updates of this plan.

To classify the ecological potential of a HMWB or AWB, SEPA has assessed:

- whether or not all practicable improvements have been made to the physical characteristics of HMWBs and AWBs; •
- the impacts of other pressures including pollution pressures on the ecological quality of the water body. To do • this, it has applied the same environmental standards used in classifying the ecological status of similar unmodified water bodies (see Chapter 1 available on the SEPA website at: www.sepa.org.uk/water/river\_basin\_planning.aspx

For example, alterations to a HMWB's physical characteristics may have been sufficiently mitigated to be able to support the achievement of good ecological potential. However, if the water body's water quality is poor as a result of pollution (eq nutrient enrichment), its overall ecological potential will be classified as poor.

Ecological potential class	Basis of classification
Maximum	All practicable mitigation measures are in place to ensure the water body's physical characteristics are maintained in as good a condition as possible without significantly impacting on a designated use (eg hydropower generation) or the wider environment
	Water quality is high.
	Other pressures are having no more than a very minor impact.
Good	All practicable mitigation measures, other than those expected to cumulatively provide only very minor ecological benefit, are in place to ensure the water body's physical characteristics are maintained in as good a condition as possible without significantly impacting on a designated use or the wider environment.
	Water quality is good.
	Other pressures are causing no more than slight ecological effects.

#### Table 3: Classification status classes for heavily modified and artificial water bodies

<sup>5</sup>The Scotland River Basin District (Classification of Water Bodies) Directions 2009 www.scotland.gov.uk/Publications/2009/12/14130729/0 <sup>6</sup>www.scotland.gov.uk/Publications/2009/12/14130729/3

Moderate, poor or	All practicable mitigation measures, other than those expected to cumulatively provide only very
bad	minor ecological benefit, are in place to ensure the water body's physical characteristics are
	maintained in as good a condition as possible without significantly impacting on a designated use
	or the wider environment.
	BUT
	Water quality is less than good or other pressures are having more than slight ecological impacts.
	OB
	Not all practicable mitigation measures, other than those expected to cumulatively provide only very minor ecological benefit, are in place <sup>8</sup> .

#### Table 3: Classification status classes for heavily modified and artificial water bodies (continued)

In practice, it has not always been possible to differentiate between water bodies whose physical characteristics are consistent with good ecological potential and those where they are consistent with maximum ecological potential. Consequently, the physical characteristics of many HMWBs bodies have been classified as being consistent with good or maximum ecological potential.

## 3.1 Classification results for impacts from designated uses

We have split the classification results for HMWBs and AWBs into:

- classification of the water body's physical characteristics related to the designated use;
- classification of the overall ecological potential once water quality and other factors are taken into account.

This split makes it clear where mitigation measures related to the designated use are in place and where other factors (eg water quality or the presence of invasive non-native species) not related to the designated use are affecting the overall ecological potential classification.

The assessments of the ecological potential class that the physical characteristics of HMWBs and AWBs bodies in the Scotland RBD can support are summarised in Map 1 and in Tables 4a and 4b in terms of:

- (a) surface water category (river, loch, estuary, coastal);
- (b) designated use of the water body.

These results are based on the information available to SEPA as of September 2009.

If you want to find out about the classification results for a particular water body, please use the interactive map on SEPA's website at: www.sepa.org.uk/water/river\_basin\_planning.aspx

<sup>8</sup>For a HMWB for which the mitigation needed to achieve good ecological potential is not in place, classification as moderate, poor or bad indicates the relative severity of the ecological impacts of the bodies' physical alterations.

# 4. Objectives for heavily modified and artificial water bodies

Our objectives for improving the ecological potential of HMWBs and AWBs are intended to strike the right balance between the protection and improvement of the water environment (taking account of the benefits this brings) and the interests of those who depend on it for their livelihoods and quality of life. By definition, none of the objectives should have a significant adverse affect on the beneficial objectives served by the modified or artificial characteristics of the water bodies.

Further information on how we have set objectives is described in Chapter 2 available online at www.sepa.org.uk/water/river\_basin\_planning.aspx The process of setting objectives for HMWBs and AWBs has benefited in particular from information provided by water users and other interested parties in a series of workshops organised by SEPA.

If you would like information on the objectives for particular water bodies, please use the interactive map on SEPA's website at: www.sepa.org.uk/water/river\_basin\_planning.aspx

The improvements identified for HMWBs and AWBs have been split into:

- improvements to the bodies' heavily modified or artificial physical characteristics;
- improvements to the overall ecological potential.

This makes it clear where improvements related to the designated use are being made by water managers and where other factors (eg water quality) not related to the designated use are affecting the overall ecological potential.

For a number of water bodies, we have phased improvements to the bodies's heavily modified or artificial physical characteristics. Among other benefits, this will enable significant environmental improvements to be made without significant adverse impacts on the benefits provided by the uses of water bodies. For example, if made straight away, an improvement that would result in a given reduction in the output provided by a use might constitute a significant adverse impact. However, if phased over the longer term, the reduction might be offset by increases in output made elsewhere during the intervening period and consequently not represent a significant adverse impact.

## 4.1 Improvement objectives for HMWBs and ASWBs

Tables 6 and 7 provide summary information on our objectives for:

- HMWBS used to provide water storage for hydropower generation, public water supply, flood protection, land drainage or navigation;
- HMWBs and AWBs used for inland navigation.

The improvements for the physical characteristics of the heavily modified and artificial water bodies were identified based on consideration of:

- the confidence in the classification;
- the spatial extent of adverse impacts;
- the scale of mitigation required and hence the costs and the extent of technical planning and preparation required;
- planned asset refurbishment or replacement schedules.

These considerations helped to identify environmental priorities and balance them against judgements of what was likely to be technically feasible and proportionate to achieve over a given timescale. Those companies and organisations relying on the heavily modified or artificial characteristics provided information to SEPA to inform these judgements. As described in Annex 2: Consultation and engagement, other stakeholders were also consulted as part of this process.

## 4.2 Overall improvement objectives for HMWBs and AWBs

Tables 8 and 9 combine the improvements planned to the modified or artificial physical characteristics of heavily modified and artificial water bodies with the improvements planned to address the impacts of other pressures, such as pollution.
