

Bathing Water Profile for Eyemouth

Eyemouth, Scotland

Current water classification <https://www2.sepa.org.uk/BathingWaters/Classifications.aspx>

Today's water quality forecast <http://apps.sepa.org.uk/bathingwaters/Predictions.aspx>

Description The bathing water is situated next to Eyemouth town in the Scottish Borders. It is a small, shallow sandy bay of about 0.3 km in length. The beach is popular with families during the summer months.

During high and low tides the approximate distance to the water's edge can vary from 0–100 metres. For local tide information see:

<http://easytide.ukho.gov.uk/EasyTide/index.aspx>

Site details

Local authority	Scottish Borders Council
Year of designation	1999
Water sampling location	NT 94463 64524

Catchment description

A catchment area of 120 km² drains into Eyemouth bathing water. The main rivers in the bathing water catchment are the Eye Water, Ale Water, Horn Burn and the North Burn.

Agriculture is the major land use in the catchment. The upland areas are almost exclusively livestock rearing areas whereas the lower parts of the catchment include more arable farming. The catchment includes the urban area of Eyemouth town.

Average summer rainfall for the region is 296 mm compared to 331 mm across Scotland as a whole.

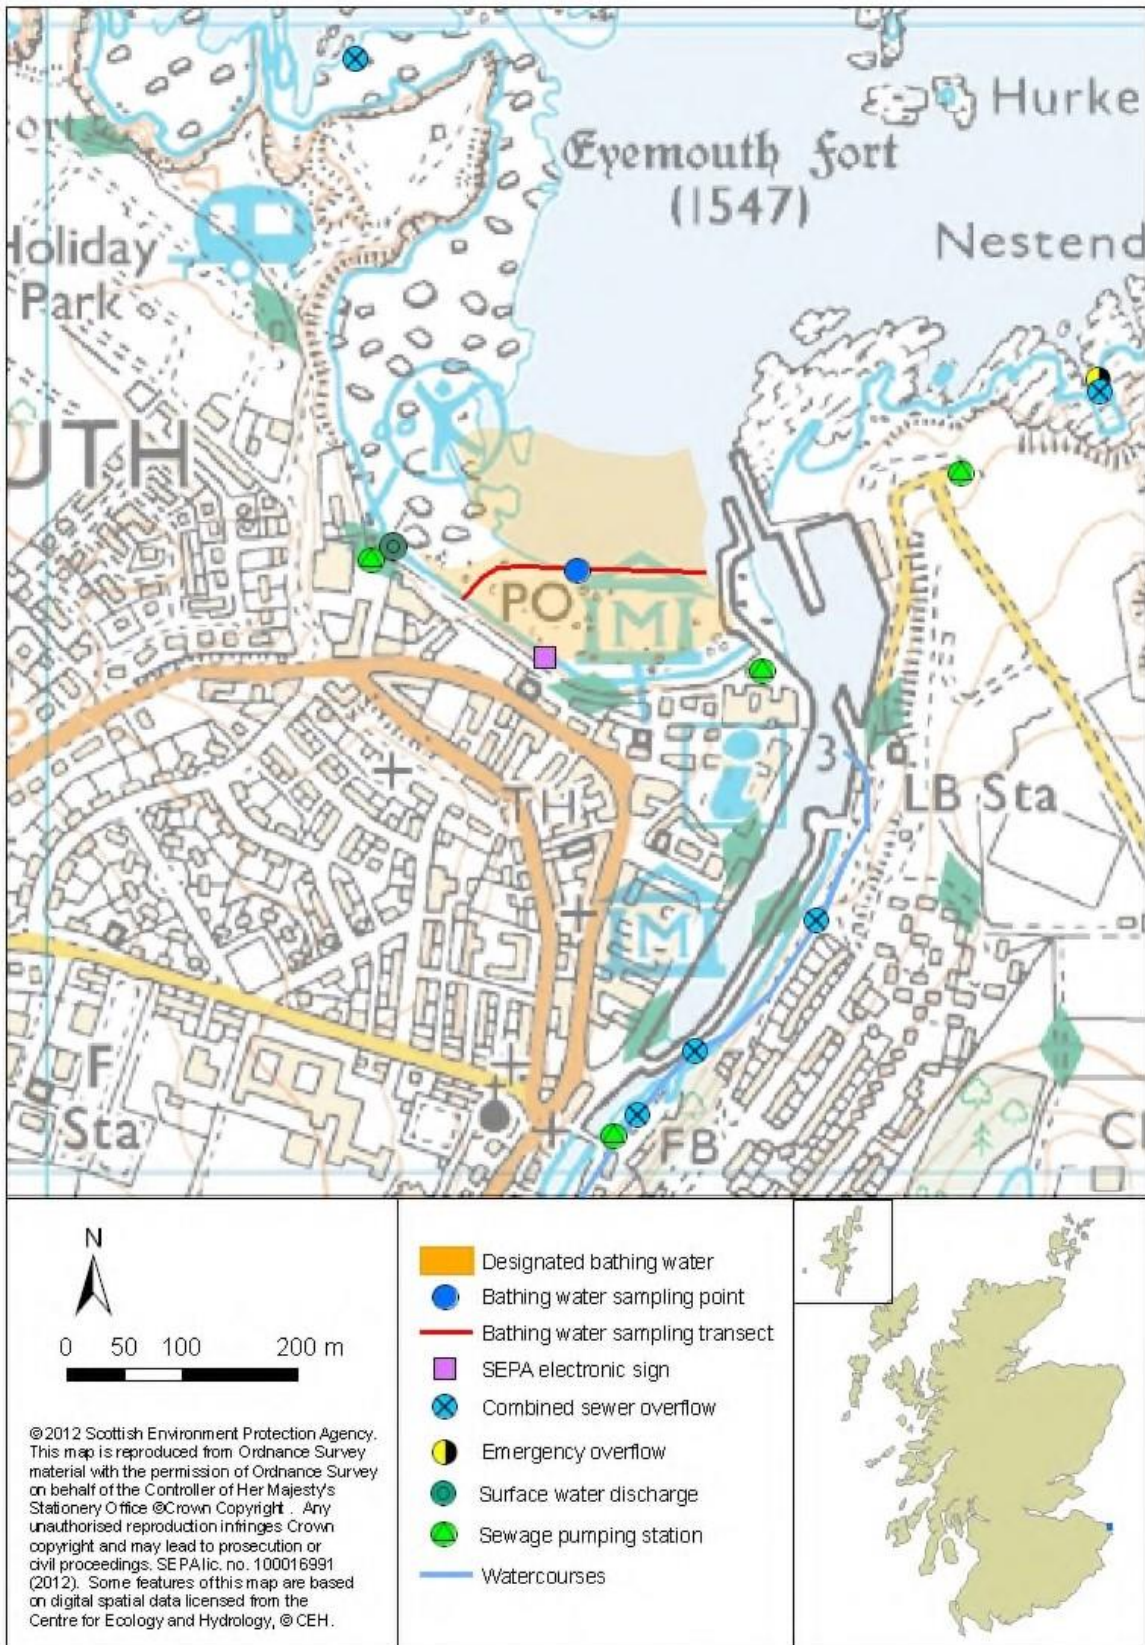

Risks to water quality

This bathing water is subject to short term pollution when heavy rainfall washes bacteria into the sea. Pollution risks include agricultural run-off and combined sewer overflows. These are highlighted on Map 1.

There is a risk that water pollution may occur after heavy rainfall. **Bathing is not advised during or 1-2 days after heavy rainfall. This is due to the risk to bathers' health from water pollution.**

DNA tracing indicates that human sources and animal sources are contributing to faecal pollution of the bathing water.

Daily water quality forecasts

Water quality is forecast on a daily basis during the bathing season (1 June to 15 September). The forecasts indicate that water quality is either acceptable or poor. Warnings against bathing are advised when poor water quality is forecast. This is because there is an increased risk to bathers' health from water pollution.

Forecasts are communicated via an electronic message sign at the beach, SEPA's website, mobile website and Beachline (03000 996699).

Improving bathing water quality

Improving diffuse pollution from agricultural sources

Diffuse pollution from agricultural sources is the result of cumulative inputs of pollutants to rivers and streams.

Farm visits to identify diffuse pollution sources in the Eye Water catchment began in 2012. Incidences of livestock entering watercourses was recorded and mitigation measures were agreed to address this. Large areas along watercourses were fenced off from livestock and alternative water sources provided for them. The priority catchment program is now complete.

Even though all agricultural compliance work has been completed in this bathing water catchment and all farms are in a compliant state. SEPA will continue to engage with farmers and the NFUS to remind them of good practice when applying slurries and manures and grazing livestock.

Improving pollution from sewage and other discharges

Scottish Water provides most waste water collection and treatment services in Scotland.

A significant source of faecal contamination was removed from the Eye Water when Scottish Water began pumping sewage from Aytoun to Eyemouth sewage treatment works.

Scottish Water has carried out extensive investigations on the North Burn; however, this did not identify a source of microbial loading or any further issues with the surface water drainage system.

Improving pollution from diffuse urban sources

Urban diffuse source pollution comes from contaminated rainwater discharging to rivers and streams. SEPA, local authorities and Scottish Water are working together to tackle urban diffuse pollution. Sustainable Urban Drainage Systems (SUDS) have been incorporated into local plans and partner organisations have been encouraged to retrofit SUDS where possible.

Following discussions with SEPA, road gully cleaning operations have been improved by Scottish Borders Council. This helps to prevent polluting substances from entering the bathing water.

Cyanobacteria (blue-green algae)

Marine waters are not at risk of cyanobacteria overproduction.

Algae

Current information suggests that this bathing water is not at risk of excessive growth of macroalgae (seaweed) or phytoplankton.

Jellyfish

There is a possibility of increased numbers of jellyfish in the water during summer months. This is a naturally occurring phenomenon. Most species common to the UK are harmless. The Marine Conservation Society advises to 'look but don't touch'.

Responding to pollution incidents

Please use our 24 hour hotline (0800 80 70 60) to report pollution. SEPA will investigate the incident and contact other relevant organisations. That may include Scottish Ministers, Scottish Water, the local authority and the relevant health board. Where necessary, measures will be put in place to resolve the problem.

If beach users or bathers are considered to be at risk, the local authority will warn the public by erecting signs at the bathing water. Information will also be available on our website.

SEPA will investigate whenever our sampling identifies pollution. Further sampling of the bathing water and related rivers and streams is undertaken.

Beach users are encouraged to use the bins provided or to take litter home. Beach cleaning and litter clean-up is maintained by Scottish Borders Council for this bathing water.
