

HEADLINE

Recovery has been seen across the country following some heavy rainfall.

North East Scotland still has catchments at Moderate Scarcity as river flows and groundwater levels remain low.

There are no areas where normal public water supplies have been affected.

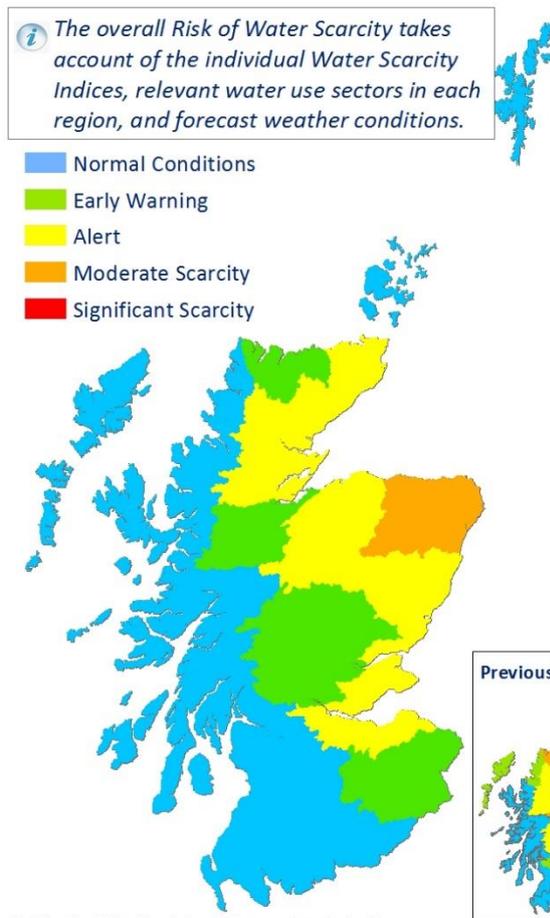

Situation summary

The water scarcity situation this week has improved across the country following rainfall from Storms Helene and Ali. However this recovery has been limited in parts of the North East, where river levels remain very low.

The advice in areas at Moderate Scarcity is still to manage water resources sustainably in order to avoid reverting to the previous situation.

Most catchments along the east coast have been held at Alert level due to extremely low groundwater levels and dry sub-surface ground conditions. It is expected that as a result of this, without maintained rainfall, river levels will fall relatively quickly following rainfall events.

The forecast for the week ahead is for further showers and this is expected to bring further relief to affected areas.

Details of the Water Scarcity Level triggers and required actions can be found in Scotland's National Water Scarcity Plan ([link below](#))

We are monitoring the situation closely and coordinating steps to manage water resources in line with [Scotland's National Water Scarcity Plan](#).

Scottish Water is managing water supplies across Scotland through this extended dry period and will continue to monitor the situation closely. Advice has been issued to all customers to use water wisely nationwide ([link to advice www.scottishwater.co.uk/about-us/media-centre/latest-news/customers-across-scotland-asked-to-use-water-wisely](http://www.scottishwater.co.uk/about-us/media-centre/latest-news/customers-across-scotland-asked-to-use-water-wisely)).

SEPA is working with businesses to help ensure abstractions can be sustained and the water environment protected.

General and sector specific advice for abstractors is available: [Advice for abstractors](#).

Water abstractors with concerns about meeting licence conditions or wishing to discuss contingency measures should [contact their local SEPA office](#).

Scottish Water and Local Authorities are working together to help maintain supplies. If your private water supply is drying up you should contact your local authority for assistance and follow the advice about [maintaining your private supply](#).

Forecast (at 20/09/18): Based on information from the UK Met Office

The heavy rain from Storm Ali will clear away east through Friday morning followed by cool and showery conditions for the remainder on Friday and Saturday. Sunday will be mainly dry, with a small risk of heavy rain in the south and east. Scattered showers in the North on Monday.

The longer-term outlook still shows a slightly higher likelihood of drier and warmer conditions than normal over the next three months for the UK. For further details on the seasonal forecast see the latest report at <http://www.hydoutuk.net>.

Further details on the current situation are provided in the following figures:

18/09/2018

Precipitation Indices

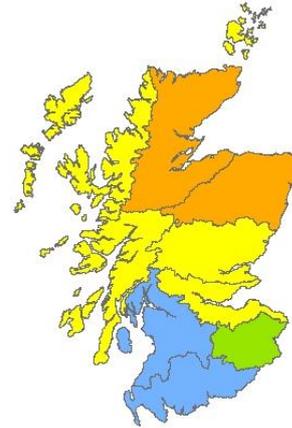

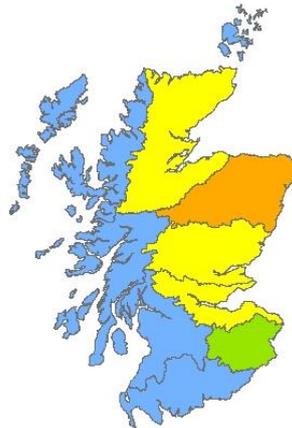

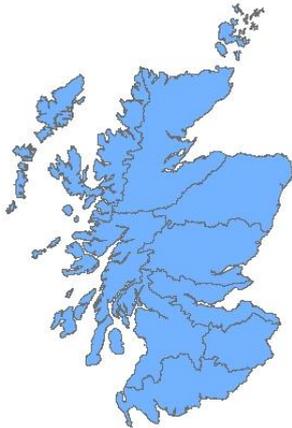

Rainfall over the past 30 days

Rainfall over the past 90 days

Rainfall over the past 180 days

These maps show how low current rainfall totals are for this time of year, relative to historical averages, over the past 30, 90 and 180 days.

- Normal Conditions
- Quite Dry
- Dry
- Very Dry
- Exceptionally Dry

Soil Moisture Deficit Maps

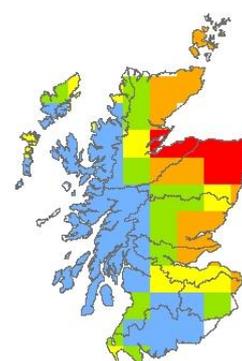

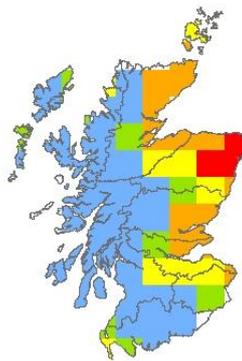

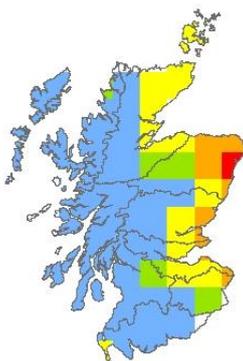

Soil Moisture Deficit Current

Soil Moisture Deficit 7 days prior

Soil Moisture Deficit 14 days prior

These maps depict the latest Soil Moisture Deficit (SMD) data and the SMD 7 and 14 days prior.*

- No Data
- No Deficit
- Quite Dry
- Dry
- Very Dry
- Exceptionally Dry

* MORECS data obtained from MetOffice

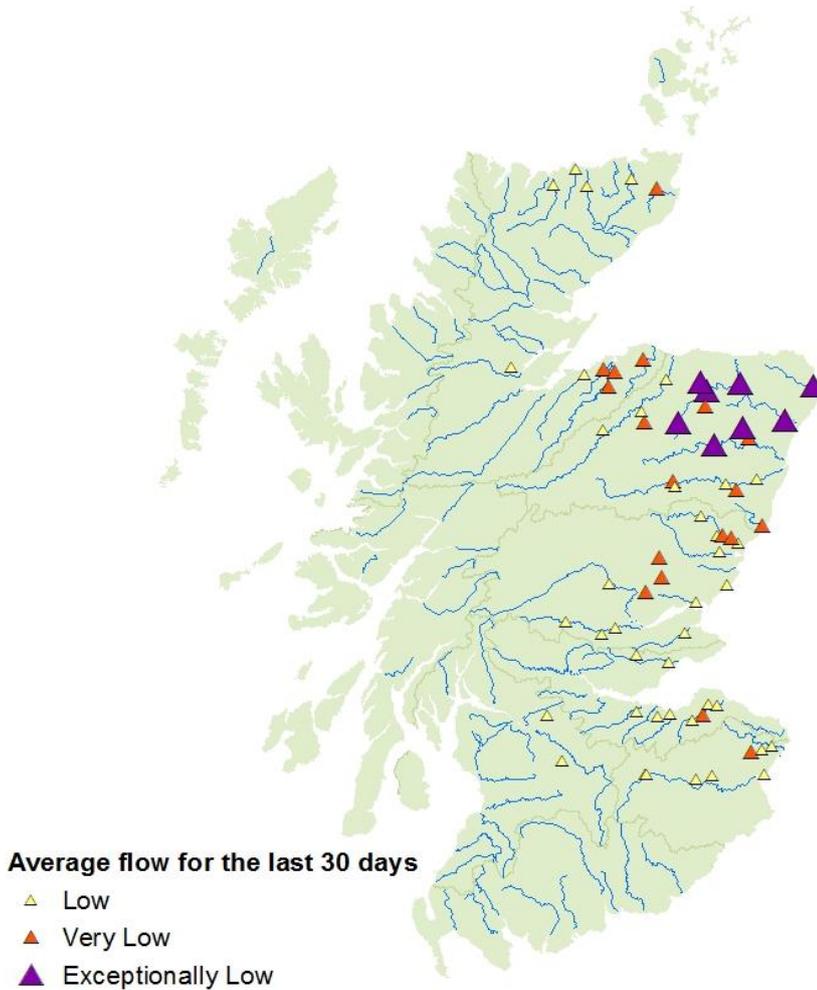

Average flow over the last 30 days

20/09/2018

This map shows the average flow at SEPA's gauging stations over the past 30 days, highlighting sites which have been at very low flows for this period.

Evidence shows that river ecology is at high risk when very low flows are maintained for this length of time.

Notes on exceptionally low flows:

- In the figure above, those sites marked as exceptionally low have had the types of low flows normally seen only a few days per year, persisting for at least a month.
- Even in areas where flows have not reached this extremely low level the advice to use water wisely still applies.

Further information from SEPA's water level stations can be found at <http://apps.sepa.org.uk/waterlevels/>.

Natural water storage situation

In each river catchment there is some degree of water storage, which can maintain river flows even when it is not raining. This natural water storage is mainly held in lochs and groundwater. When natural storage has been depleted it will take a lot of rainfall for levels to recover.

Please note that the map below does not reflect conditions in managed water supply reservoirs.

20/09/2018

North East

**Groundwater levels - very low
Loch storage – low**

Very low groundwater levels in the Northeast area compared to the long-term record. With current conditions it will take a long time for levels to return to normal.

Loch levels in this area are also low following the dry summer but have shown some recent recovery following rainfall, particularly in the North Highlands.

West and South – Recovering

Loch level data indicate that storage is recovering in this area.

Where groundwater level data is available, it shows that levels are largely within the normal range, and some recovery of levels is evident.
