99, Table 33(a)

The concentration of ¹³⁷Cs in clay at Outfall (Pangbourne) was 12±0.15 Bq kg⁻¹ (dry)

133, Appendix 3

The average consumption rates of nuts and offal by 10 year old children were 1.5 kg y⁻¹.
The consumption of whelks at Sellafield by group E (Whitehaven commercial) was 11 kg y⁻¹.

138, Appendix 6

The values of t_f and t_s were 0. The transfer factors for beef offal (²⁴¹Pu) and lamb (²⁴¹Pu) were 2 10⁻² and 4 10⁻⁴ respectively.

Concentrations in sediments	For sediment samples with unusually high water contents it was discovered in 2007 that the resulting sample bulk densities were outside the instrument calibration range. Following investigations a correction factor has been calculated and this has been applied to the affected data from 2002-2005 and the new results are reported here in Table E2.

^a Selected on the basis of providing the highest dose from the pathways associated with the sources as defined in A, B or C

^b Pathways and radionuclides that contribute more than 10% of the total dose. Some radionuclides are reported as being at the limits of detection and based on these measurements, an upper estimate of dose is calculated

^c The assessed contribution is based on data being wholly at limits of detection

^d The effects of gaseous discharges and direct radiation are not assessed for this site

^e The effects of liquid discharges from Sellafield, Whitehaven and LLWR near Drigg are considered together when assessing exposures at these sites because their effects are manifested in a common area of the Cumbrian coast

^f The doses from man-made and naturally occurring radionuclides were 0.040 and 0.021 mSv respectively. The source of naturally occurring radionuclides was a phosphate processing works near Sellafield at Whitehaven. Minor discharges of radionuclides were also made from the LLWR near Drigg into the same area

^g The highest exposure due to operations at Sellafield was to a person living on a houseboat near Barrow
