

HEADLINE

Alert level of water scarcity is no longer in place in any area.

Early Warning of water scarcity remains in place across the country.

Situation summary

Following rainfall in the last week, surface conditions and river levels have improved across the country. Areas previously at Alert level have now been downgraded to Early Warning level.

Groundwater levels have shown signs of recovery as rainfall in May for the majority of the country was above average. Levels remain below average for the time of year.

Further forecast rain will continue to improve the short-term outlook for the whole country. However, conditions will deteriorate again in any further dry period due to low groundwater levels, particularly in the east.

Advice for water users

Despite the improving picture across the whole of Scotland we would still advise that farmers using water for irrigation:

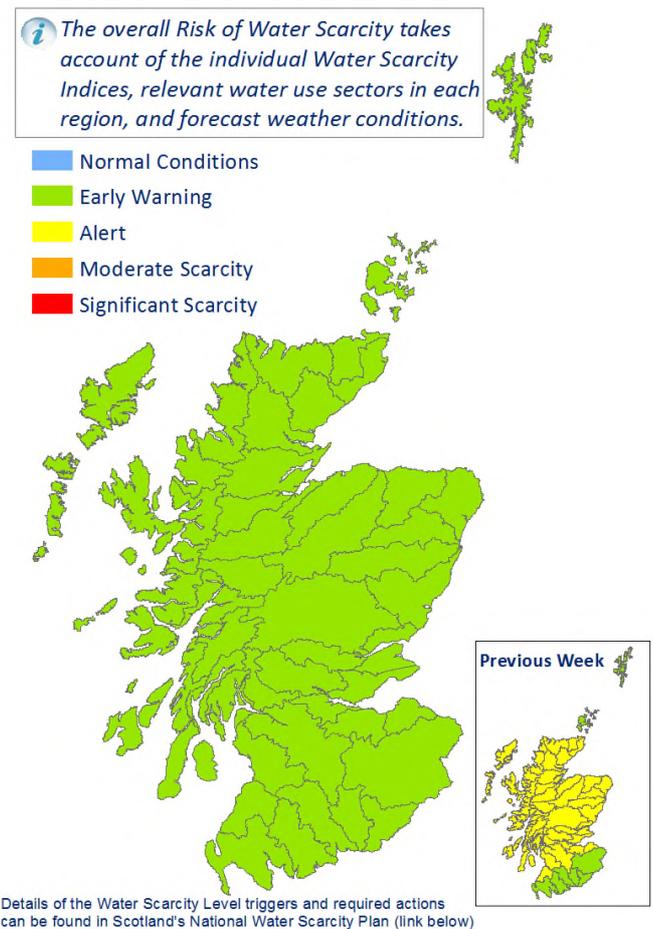

:

- Only irrigate when, and only as much as, absolutely necessary;
- Make sure irrigation equipment isn't leaking;
- Try to irrigate at night to reduce evaporation losses;
- Explore how you and your neighbours in the same river catchment could avoid irrigating at the same time;

Managers of golf courses are asked to do the same.

SEPA are monitoring the situation closely and coordinating steps to manage water resources in line with [Scotland's National Water Scarcity Plan](#). If you have noticed any impact as a result of the dry weather, we would be interested in hearing about them. For further details on reporting impacts of dry weather see <https://www.sepa.org.uk/environment/water/water-scarcity/>.

Figure 1: Current Water Scarcity Level

General and sector specific advice for abstractors is available: [Advice for abstractors](#). Water abstractors with concerns about meeting licence conditions or wishing to discuss contingency measures should [contact their local SEPA office](#).

Rainfall forecast (Source: Met Office 05/06/2019)

Mainly dry Friday but occasionally heavy rain moving north through Friday evening and Saturday, heaviest and most persistent in the west. Further rain or showers Sunday, but with low confidence on details.

The longer-term outlook is uncertain. For June-July-August as a whole, the chances of above- and below-average precipitation across the UK are similar. On balance, wetter-than-average conditions are marginally more likely. For further details on the seasonal forecast see the latest 3-month outlook summaries at <https://www.metoffice.gov.uk/services/government/contingency-planners/index>.

Further details on the current situation are provided in the following figures:

Precipitation Indices

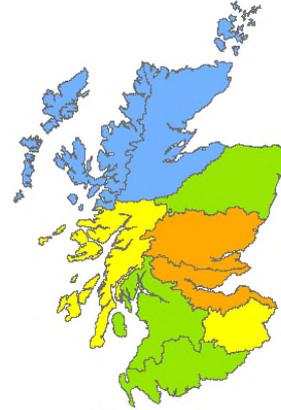

Rainfall over the past 30 days

Rainfall over the past 90 days

Rainfall over the past 180 days

These maps show how low current rainfall totals are for this time of year, relative to historical averages, over the past 30, 90 and 180 days.

- Normal conditions
- Quite dry
- Dry
- Very dry
- Exceptionally dry

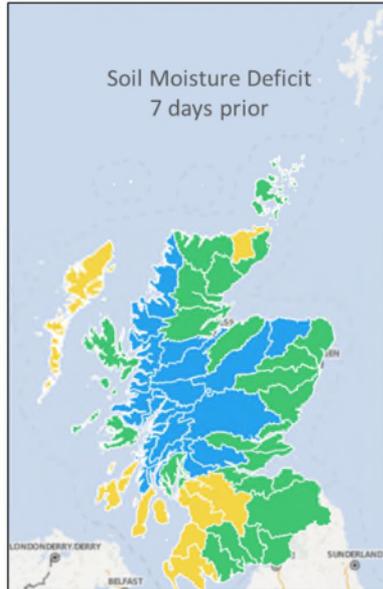

05/06/2019

Soil Moisture Deficit

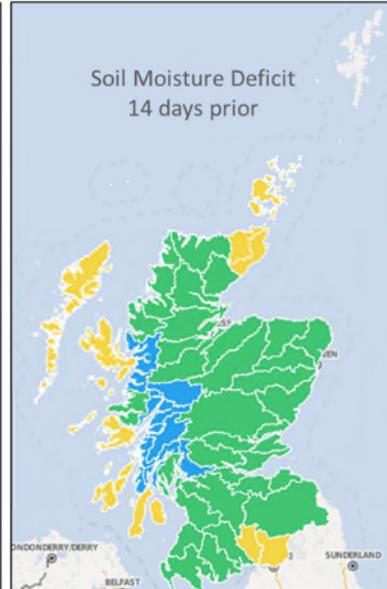

Soil Moisture Deficit Current

Soil Moisture Deficit 7 days prior

Soil Moisture Deficit 14 days prior

These maps depict the latest Soil Moisture Deficit (SMD) data * and the SMD 7 and 14 days prior.

- No Deficit
- Quite Dry
- Dry
- Very Dry
- Exceptionally Dry

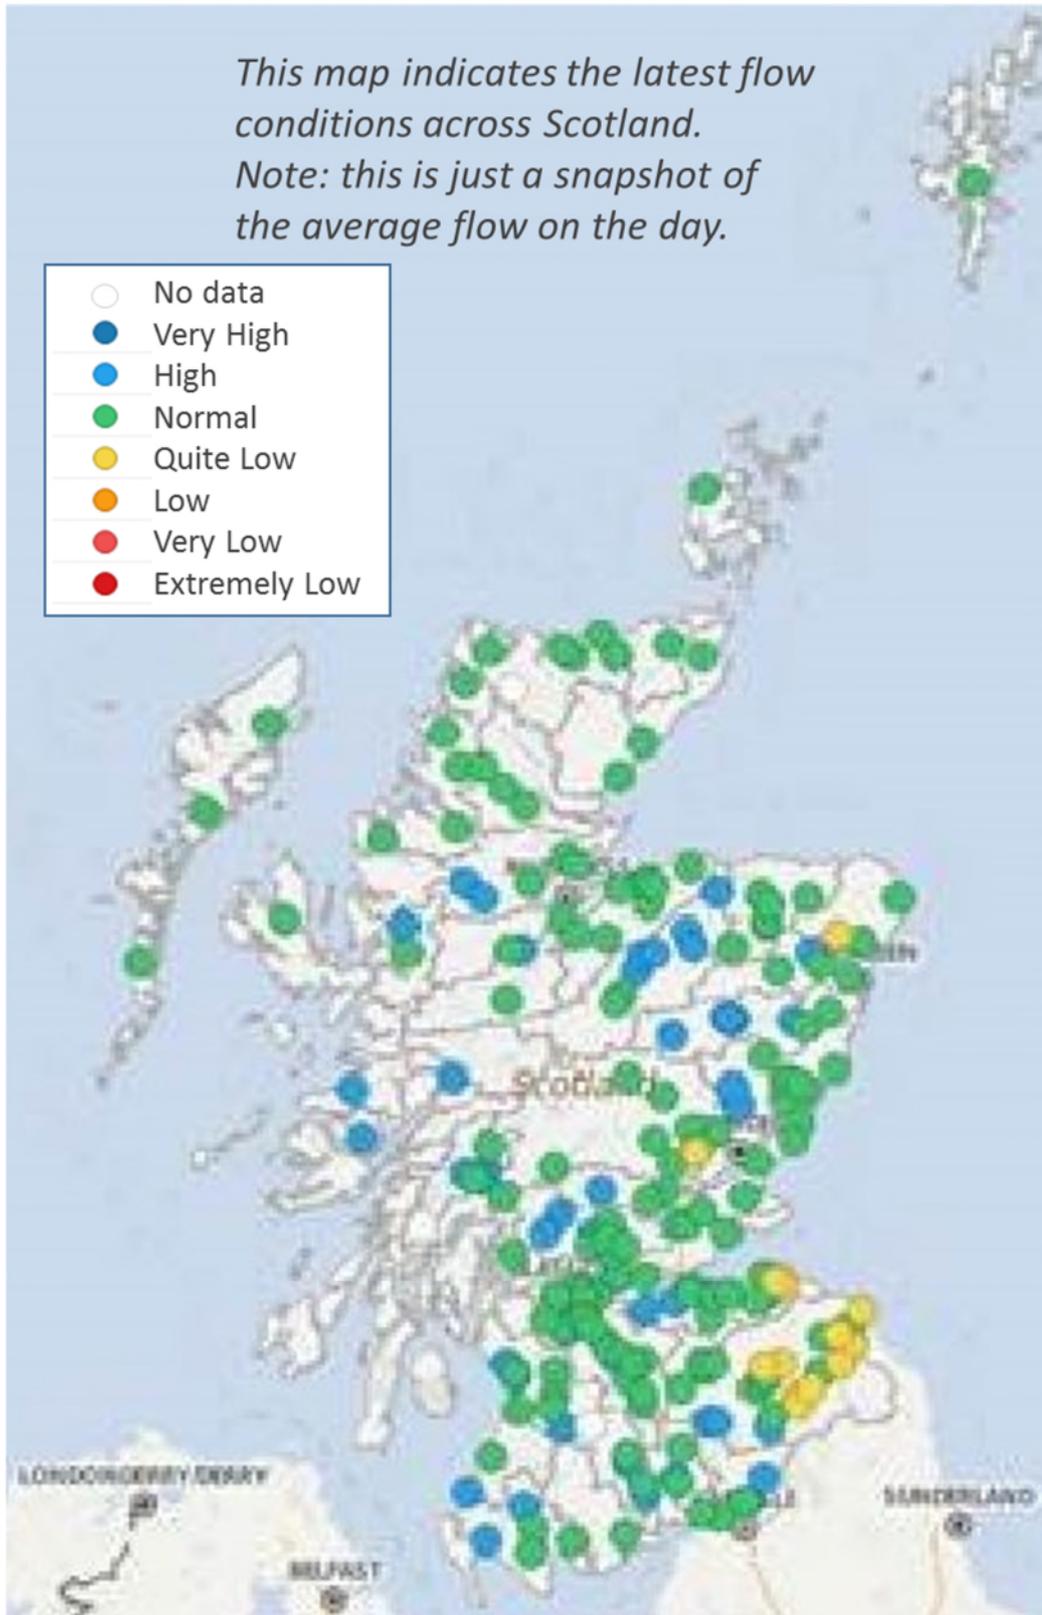

*MORECS data obtained from MetOffice

Current Flow Conditions

This map indicates the latest flow conditions across Scotland.

Note: this is just a snapshot of the average flow on the day.

Natural water storage situation

In each river catchment there is some degree of water storage, which can maintain river flows even when it is not raining. This natural water storage is mainly held in lochs and groundwater. When natural storage has been depleted it will take a lot of rainfall for levels to recover.

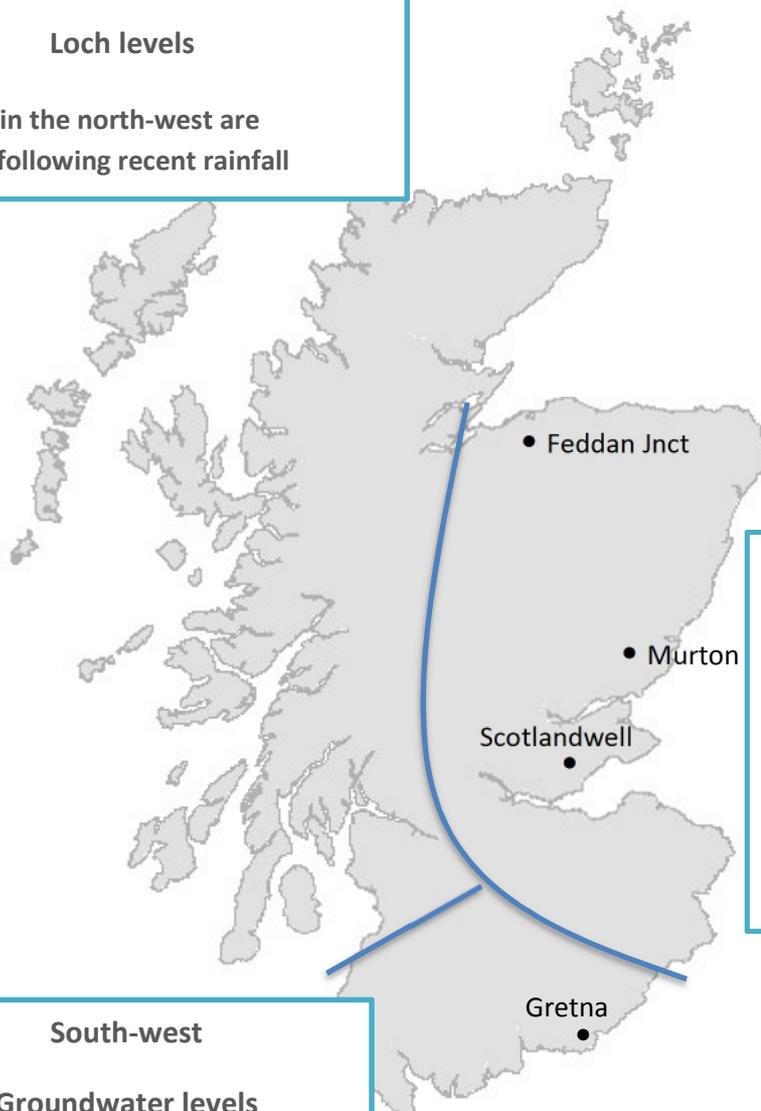

Please note that the map below does not reflect conditions in managed water supply reservoirs.

North-west

Loch levels

Loch levels in the north-west are recovering following recent rainfall

East

Groundwater levels

Groundwater levels along the east coast are rising but are still low for the time of year compared to the long-term record (see the graphs below as an example).

South-west

Groundwater levels

Groundwater levels in this region are average for this time of year.

These charts show the trend in groundwater and loch levels since autumn 2018 at selected monitoring sites in the northeast (see map above). The white zone represents the observed range in the long-term record. The black line shows the actual groundwater level and the dashed line is the long-term average trend.

Record high groundwater level
Normal groundwater level range
Record low groundwater level
