Scottish Household waste - summary data - 2021

This release shows the 2021 calendar year summary of household waste generated in Scotland and managed by or on behalf of Scottish local authorities. Information on the methodology used to prepare this release and a definition of terms is in the methodology and glossary at the end of this document.

Key points

Scottish Household waste – 2021 calendar year

- The total amount of household waste generated in Scotland was 2.48 million tonnes (Table 1) in 2021, an increase of 55,000 tonnes (2.3%) from 2020.
- For 2021, the Scottish household waste recycling rate¹ was 42.7% an increase of 0.7 percentage points from the 42.0% (Table 1) rate achieved in 2020. The amount of household waste recycled between in 2020 and 2021 increased by 41,000 tonnes (4.0%) to 1.06 million tonnes.
- The increase in waste recycled between 2020 and 2021 is likely due to a bounce back from the impact of the COVID-19 lockdown and other restrictions in 2020, in which the amount of waste recycled and the waste recycling rate was the lowest recorded since 2013.
- The amount of Scottish household waste landfilled in 2021 was 664,000 tonnes, an increase of 4,000 tonnes (0.6%) from 2020, however a reduction of 790,000 tonnes (54.4%) since 2011. This is the first time in ten years that there has not been a decrease in household waste landfilled. There was, however, a decrease in the landfill rate from 2020 (27.2%) and 2021 (26.7%) of 0.4 percentage points.
- For 2021, the total amount of Scottish household waste managed by other diversion from landfill was 758,000 tonnes, an increase of 10,000 tonnes (1.4%) from 2020. Most of the diverted waste in 2021 was managed by incineration (612,000 tonnes, 80.7%), which was also the case in 2020, although the proportion of the total was higher (81.9%) in 2020.
- The carbon impact of Scottish household waste generated and managed in 2021 was 5.9 million tonnes of carbon dioxide equivalent (TCO2e, Table 1), which is the equivalent to 1.08 TCO2e per person (Table 2). This was an increase of 53,000 TCO2e (0.9%) from 2020, however a reduction of 0.86 million TCO2e from 2011.

Summary data tables are also available to download in Excel format on SEPA's web site.

³ Note: The carbon impact of mixed residual household waste is based on a national <u>waste composition study</u> and therefore does not reflect any difference in waste composition which may exist between Local Authorities. Population data is from the National Records of Scotland 2021 <u>mid year population estimates</u>.

Trends

• The total amount of household waste generated in Scotland in 2021 was 2.48 million tonnes, an increase of 55,000 tonnes (2.3%) from in 2020. This follows a 6,000 tonne (0.3%) increase between 2019 and in 2020. Overall there has been a general fluctuation of waste generated between 2.4 and 2.5 million tonnes since 2012 (see Figure 1 below).

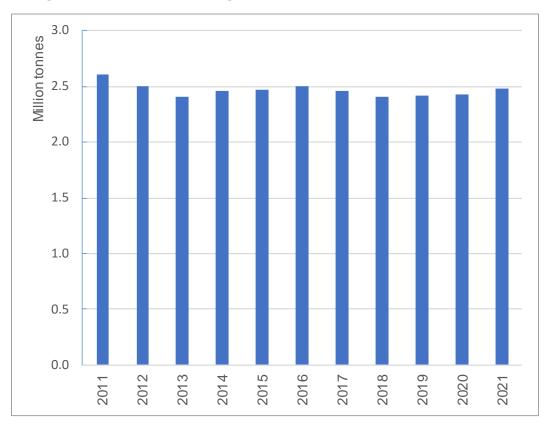

Figure 1. Household waste generated in Scotland 2011 - 2021.

| Table 3. Household waste | generated in | Scotland 2011 | - 2021 |
|--------------------------|--------------|---------------|--------|
|--------------------------|--------------|---------------|--------|

| Year | Waste generated (tonnes) |
|------|--------------------------|
| 2011 | 2,606,759 |
| 2012 | 2,500,995 |
| 2013 | 2,412,651 |
| 2014 | 2,459,557 |
| 2015 | 2,468,777 |
| 2016 | 2,498,975 |
| 2017 | 2,460,830 |
| 2018 | 2,405,251 |
| 2019 | 2,421,797 |
| 2020 | 2,428,271 |
| 2021 | 2,483,304 |

- The amount of segregated recyclate collected for recycling via kerbside collections in 2021 was 721,000 tonnes, an increase of 5,400 tonnes (0.7%) from 2020. The increase in collection of recyclate via kerbside schemes has been trending upwards, with a 24.8% increase in collection of recylate since 2013⁴ (see Figure 2 below).
- The percentage of recyclate collected via kerside schemes, as a total of all recyclate collected, decreased between 2020 and 2021 by 2.9 percentage points (see Figure 2 below). This was due to an increase in the amount of waste collected for recycling by other methods in 2021, such as household waste recycling centres, which were closed by many local authorities in 2020 due to COVID-19 restrictions and re-opened again in 2021.

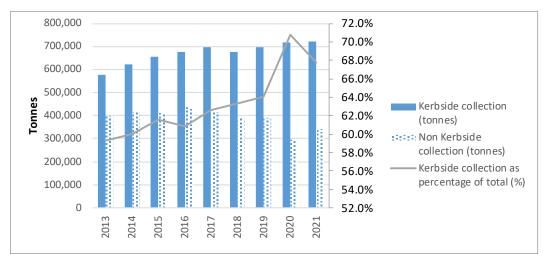

Figure 2. Scottish segregated recyclate collected 2013 - 2021 (tonnes)

| Table 4. | Scottish segregated recyclate collected 2013 - 2021 (tonnes) |
|----------|--|
|----------|--|

| Year | Kerbside collection (tonnes) | Non Kerbside collection (tonnes) | Total (tonnes) | Kerbside collection as percentage of total (%) |
|------|------------------------------------|--|----------------|---|
| 2013 | 578,096 | 397,481 | 975,578 | 59.3% |
| 2014 | 624,008 | 415,710 | 1,039,718 | 60.0% |
| 2015 | 655,866 | 409,845 | 1,065,710 | 61.5% |
| 2016 | 676,979 | 435,485 | 1,112,464 | 60.9% |
| 2017 | 696,414 | 416,542 | 1,112,956 | 62.6% |
| 2018 | 674,830 | 390,916 | 1,065,746 | 63.3% |
| 2019 | 695,937 | 390,359 | 1,086,297 | 64.1% |
| 2020 | 715,911 | 296,013 | 1,011,924 | 70.7% |
| 2021 | 721,275 | 342,463 | 1,063,738 | 67.8% |

⁴The time series commences with 2013, as the non-kerbside collection dataset was analysed using WasteDataFlow question 100, which was introduced in 2013.

6

 The change in kerbside collection between 2020 and 2021 was more pronounced for rural authorities⁵ (an increase of 4,700 tonnes, 1.6%) compared to urban authorities (an increase of 600 tonnes, 0.1%, see Figure 3 below).

Table 6. Household waste managed in Scotland 2011-2021

*The definition of recycling changed in 2014 to exclude non PAS compost. Recycling data for 2011 - 2013 has been modelled under the new definition to provide consistency for the time series

Waste Recycled

- Waste recycled includes waste reused or recycled and composted. A full description of recycling is given in the glossary.
- For 2021, the Scottish household waste recycling rate was 42.7% (see Figure 5 below), an increase of 0.7 percentage points from the 42.0% recycling rate achieved in in 2020, and an increase of 3.2 percentage points from the 39.5% achieved in 2011⁶.

For 2021, the total tonnage of Scottish household waste recycled was 1.06 million tonnes, an increase of 41,000 tonnes (4.0%) from 2020 and 31,000 tonnes (3.0%) greater than the 1.03 million tonnes of waste recycled in 2011⁶.

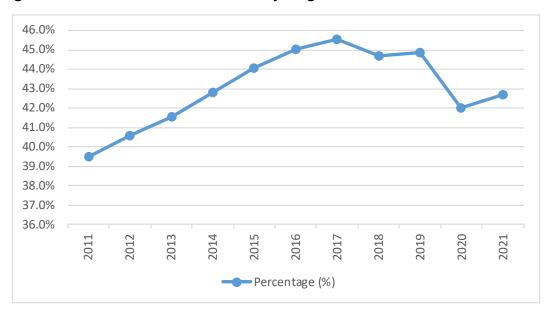

Figure 5. Scottish household waste recycling rates 2011-2021⁶

Note: Recycled includes waste recycled or reused and waste composted.

| Year | Percentage (%) |
|------|----------------|
| 2011 | 39.5% |
| 2012 | 40.6% |
| 2013 | 41.5% |
| 2014 | 42.8% |
| 2015 | 44.1% |
| 2016 | 45.0% |
| 2017 | 45.5% |
| 2018 | 44.7% |
| 2019 | 44.9% |
| 2020 | 42.0% |
| 2021 | 42.7% |

Table 7. Scottish household waste recycling rates 2011-2021⁶

• In 2021, of the 1.06 million tonnes of household waste recycled, the majority (677,000 tonnes, 63.8%) was recycled or reused, with household waste composted contributing the remaining 384,000 (36.2%) (see Figure 6 below).

OFFICIAL

⁶ The definition of recycling changed in 2014 to exclude non PAS compost. Recycling data for 2011 - 2013 has been modelled under the new definition to provide consistency for the time series

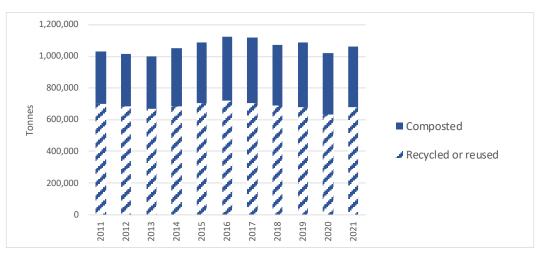

Figure 6. Breakdown of Scottish household waste recycled 2011-2021

Table 8. Breakdown of Scottish household waste recycled 2011-2021

| Year | Recycled or reused | Composted | Total |
|------|-----------------------|-----------|-----------|
| 2011 | 697,904 | 331,840 | 1,029,744 |
| 2012 | 685,648 | 328,997 | 1,014,645 |

| 2018 | 691,963 | 382,713 | 1,074,676 |
| 2019 | 681,698 | 404,570 | 1,086,268 |
| 2020 | 631,909 | 388,376 | 1,020,285 |
| 2021 | 677,434 | 383,608 | 1,061,042 |

Waste recycled or reused

- The 677,000 tonnes of Scottish household waste recycled or reused in 2021 was an increase of 46,000 tonnes (7.2%) compared with 2020 (see Figure 6 above). There was a 7.3% drop in Scottish household waste recycled or reused between 2019 and 2020, and that year was the lowest recorded since 2011. Most authorities have attributed this dip in 2020, and subsequent increase in 2021, to COVID-19 lockdown restrictions being imposed and then lifted. The amount of waste recycled or reused has been flat since 2011, sitting within a range of 632,000 tonnes (2020) to 721,000 tonnes (2016) during this period (see Figure 6 above).
- Of the seven material categories that comprised the highest amount of waste recycled or reused in 2021 (see Figure 7 below), Wood wastes showed the largest change compared with 2020 (increase of 10,000 tonnes, 14.7%) followed by Construction and soils waste (increase of 8,000 tonnes, 9.0%). The increase in the recycling or reuse of these two wastes in 2021 follows a 21.5% reduction for each in 2020. This decrease is likely due in part to a

reduction in the number and scale of home improvement projects, resulting from COVID-19 factors, such as lockdown and the inability to source raw materials. This is consistent with a reduction in the sale of ready-mixed concrete, which was down by 41% in Q2 2020 compared with Q2 2019, then recovered with an increase of 38% between Q2 2020 and Q2 2021. A similar pattern also exists for other building materials such as sand and gravel (data not shown)⁷.

- The largest material category of Scottish household waste recycled or reused in 2021 was Paper and cardboard wastes (186,000 tonnes, 27.5% of all waste recycled or reused, see Table 7 below). While there was an increase of 2.2% for these materials recycled or reused between 2020 and 2021, there is a longer term downward trend of Paper and cardboard wastes recycled or reused, with a reduction of 54,000 tonnes (22.5%) from 2011.
- The WasteDataFlow categories that contribute to Paper and cardboard wastes recycled or reused, as depicted in Figure 8 below, indicates that the recycling or reuse of segregated paper waste has been in continual decline since 2013, while that of cardboard wastes, and mixed paper and cardboard wastes have remained constant or increased over time. This may be partly due to replacement of segregated paper collections with mixed paper and cardboard collections. The decrease in segregated paper recycled or reused is also likely to be partly due to a move away from print media to electronic media. Cardboard waste recycling or reuse has not decreased in the same scale as segregated paper wastes, which could be a result of increased packaging materials as consumer shopping habits move online.

⁷ <u>Monthly Statistics of Building Materials and Components</u>, December 2021.

Notes:

Recycled includes waste recycled or reused and waste composted. Paper includes the WasteDataFlow category of Books Data series starts with 2013, which is the start for the data source of WasteDataFlow question 100

Waste Composted

- Waste composted is waste recycled by biological treatment through composting at a composting plant or through digestion at an anaerobic digestion facility.
- For 2021, the amount of Scottish household waste composted was 384,000 tonnes, a decrease of 5,000 tonnes (1.2%) from in 2020. This was an increase of 52,000 tonnes (15.6%) from 2011⁸.
- In 2021, just under three-quarters of the household waste composted was vegetal wastes (73.4%) with animal and mixed food waste, and wood wastes making up the remainder (25.9% and 0.8% respectively, see Figure 9 below). These proportions were similar in 2020. In 2011, however, the percentage of vegetal waste was higher (94.6%) and the percentages of animal and mixed food waste and wood waste were lower (5.3% and 0.14% respectively). The increase in the proportion of animal and mixed food waste over time corresponds to the roll out of segregated food waste collections by urban local authorities⁹.

⁸ The definition of recycling changed in 2014 to exclude non PAS compost. Recycling data for 2011 - 2013 has been modelled under the new definition to provide consistency for the time series

⁹ <u>The Waste (Scotland) Regulations 2012 (legislation.gov.uk)</u>

For 2021, the total tonnage of Vegetal wastes composted was 281,000 tonnes, a decrease of 4,000 tonnes (1.5%) from 2020 and a reduction of 32,000 tonnes (10.3%) from 2011¹⁰.

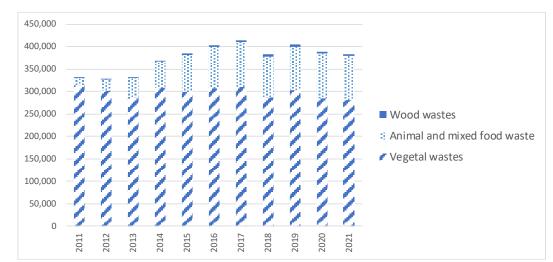

Figure 9. Scottish household waste composted by material 2011-- 2021 (tonnes)¹⁰

¹⁰ The definition of recycling changed in 2014 to exclude non PAS compost. Recycling data for 2011 - 2013 has been modelled under the new definition to provide consistency for the time series

Other Diversion from Landfill

- Other diversion from landfill is waste material not recycled or landfilled. This includes net
 waste incinerated, incinerator outputs recycled, and organic material recycled that does not
 meet quality standards. A full description is found in the glossary.
- For 2021, the total amount of Scottish household waste managed by other diversion from landfill was 758,000 tonnes, an increase of 10,000 tonnes (1.4%) from 2020 and an increase of 635,000 tonnes (515.7%) from 2011 (see Figure 10 below)¹¹.
- In 2021, most of the waste diverted was managed by incineration (612,000 tonnes, 80.7%).
- The 612,000 tonnes of Scottish household waste diverted from landfill through incineration in 2021 was 1,000 tonnes (0.2%) less than in 2020, and 542,000 tonnes (772.2%) greater than in 2011. The decrease between 2020 and 2021 was mainly due to increases in Household and similar wastes (5,000 tonnes, 1.0%) and Wood wastes (6,000 tonnes, 67.4%) balanced by a decrease in Mixed and undifferentiated materials (14,000 tonnes, 16.8%). Household and similar wastes comprise primarily general refuse, and Mixed and undifferentiated materials comprise primarily rejects from sorting of general refuse and sorting of mixed wastes collected for recycling. In previous years the main management route for such wastes would be landfilling¹².

¹¹ The definition of waste diverted changed in 2014 to include non PAS compost. Waste diverted for 2011 - 2013 has been modelled under the new definition to provide consistency for the time series

¹² In the incineration and landfill statistics, the rejects from sorting of waste, which are reported to SEPA as EWC 19 12 12 coded waste, form part of the Sorting residues statistical waste category. In WasteDataFlow, there is no EWC 19 12 12 equivalent coded waste, and these wastes form part of the Household and similar wastes (rejects from sorting of residual waste) or Mixed and undifferentiated materials (rejects from source segregated recyclate) statistical waste categories.

Note: Incineration is net incineration.

Waste Landfilled

- The amount of Scottish household waste landfilled in 2021 was 664,000 tonnes, an increase of 4,000 tonnes (0.6%) from 2020, however a reduction of 790,000 tonnes (54.4%) from 2011. This is the first time in ten years that there has not been a decrease in household waste landfilled.
- For 2021, Scottish household waste landfilled as a percentage of waste generated was 26.7%. This is 0.4 percentage points lower than the proportion in 2020 (27.2%) and a decrease of 29.1 percentage points from 2011 (55.8%).
- In 2021, most of the Scottish household waste landfilled comprised Household and similar wastes (539,000 tonnes, 81.3% see Figure 12 below). The next largest category was Combustion wastes which comprised 103,000 tonnes (15.5% of the total). Combustion wastes decreased by 5,000 tonnes (4.8%) compared with 2020, but increased by 93,000 tonnes (879.8%) compared with 2011.

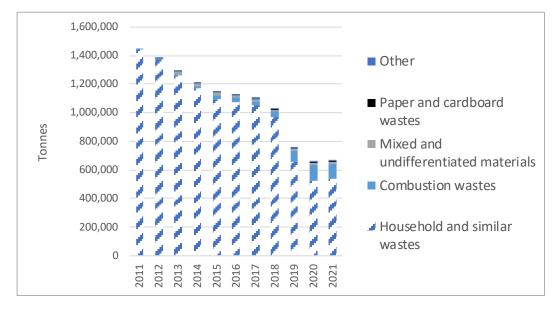

Figure 12. Scottish household waste landfilled by waste category 2011 - 2021

Carbon impacts of Scottish household waste

- The carbon impact is a measure of the whole-life carbon impacts of waste, from resource extraction and manufacturing emissions, right through to waste management emissions. Further information is available in the glossary.
- Most carbon impacts are associated with the waste generated (Table 14 below) which encapsulates the whole-life carbon impacts of the material. Negative values for Recycling and Other Diversion indicate that these waste management methods lead to carbon reductions (e.g. from reducing raw material demand) that outweigh the carbon emissions of managing the waste.
- The carbon impact of Scottish household waste generated and managed in 2021 was 5.9 million tonnes of carbon dioxide equivalent (TCO2e, see Table 14 below), which is the equivalent to 1.08 TCO2e per person (Table 2). This was an increase of 53,000 TCO2e (0.9%) from 2020.
- The amount of waste generated by Scottish households in 2021 was 4.7% below 2011 levels (see page 5). In contrast, the carbon impact of Scottish household waste generated and managed in 2021 was 12.8% (0.86 million TCO2e) below the 2011 level.
- The carbon impact of a tonne of Scottish household waste (TCO2e/tonnes of waste generated) has declined by 7% decrease between 2011 and 2021 (data not shown). This is largely a result of increased recycling rates, particularly for high impact waste materials such as non ferrous metallic wastes and glass wastes, as well as a reduction in waste generated and reduced landfilling of biodegradable waste.

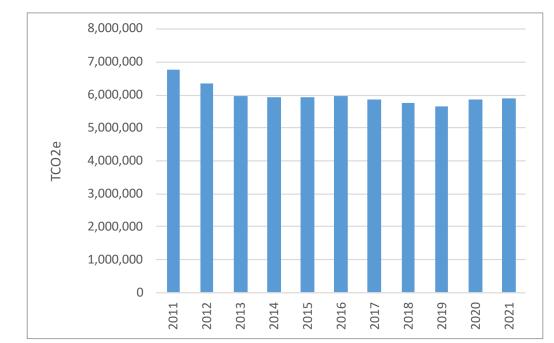

Table 14. Carbon impact of Scottish household waste generated and managed 2011 – 2021 (TCO2e)

DATA USES, FEEDBACK, REVISIONS POLICY, METHODOLOGY, GLOSSARY OF TERMS AND MEASURES, AND REFERENCES

User Statement

Data on Scottish household waste generation and management are collected to support policy development and monitor policy effectiveness, particularly the commitments in <u>Making Things Last - A Circular Economy Strategy for Scotland.</u> The data contribute to the <u>UK Statistics on waste</u> and are also used extensively by local and central government, the waste industry, researchers and the general public.

Feedback

We welcome feedback on the data from all users including how and why the data are used. This helps us to understand the value of the statistics to external users. Please see our contact details at the bottom of the first page of this notice or <u>e-mail:</u> WasteData.Flow@sepa.org.uk.

Revisions Policy

SEPA will provide information about any revisions made to published information in this statistics release and the associated datasets. Revisions could occur for various reasons, including when data from third parties is unavailable or provisional at the time of publishing or if there are subsequent methodological improvements or refinements.

The figures are accurate at the time of publication. However, the data may be updated if further revisions are necessary. Normally these revisions will be published concurrent with the next official release.

Revision to 2020 local authority data since the last household statistical publication, published in December 2021, are shown in Table 15 below.

Cells shaded in grey represent revisions amounting to a change of greater than 50 tonnes, greater than 100 TCO2e, or greater than 0.1 percentage point

Methodology

Data was submitted by all 32 Scottish local authorities using the web-based reporting tool WasteDataFlow.

From 2014, composted wastes that did not reach the quality standards set by PAS 100/110 were accounted for as other wastes diverted from landfill and not as wastes composted, except where waste was processed at a new composting or anaerobic digestion site and the site indicated they had applied for and were working toward PAS compliance, in which case a 12-month grace period was applied for the purpose of including of wastes composted in household recycling data. In 2021 there were no new sites that met this criterion.

As we move further away from the old composting measure, it becomes less important and a back series is helpful for understanding changes over a long period of time. For 2011 – 2013 the waste that met the PAS 100/110 standard was modelled to produce a back series. For each authority, the proportion of waste that was sent to a PAS 100/110 facility on average in 2014-2015 was applied to the waste sent for composting for each of the years 2011, 2012 and 2013. For example, if an authority sent 60% of its waste to a PAS 100/110 facility in 2014-15, then for the back series years of 2011, 2012 and 2013, 60% of waste sent for composting were counted as recycled. The non PAS 100/110 tonnes were allocated to the "Other Diversion" category.

Recycling figures are calculated according to Scotland's national recycling rate methodology. The methodology differs to the Waste from households measure published by Defra in its <u>UK Statistics on waste</u> publication. The differences are summarised in Table 16 below.

| Measure | Scotland national method | UK waste from households | | | | |
|--|--------------------------|--------------------------|--|--|--|--|
| Include waste sent to non PAS compost facility | * | \checkmark | | | | |
| Include construction waste from householders | \checkmark | × | | | | |
| Include metals from incineration recycled | × | \checkmark | | | | |

 Table 16. Comparison of Scotland national recycling measure vs UK waste from households measure (key differences)

Further information about differences between the national recycling measures of the four UK countries may be found in the <u>Recycling Explainer</u> published by Defra.

Further details on the methodology used to produce the figures in this document are provided in the "Household waste quality report" on <u>SEPA's web site</u>.

Waste categories used in this document are those described in the <u>EC2150/2002 Waste</u> <u>Statistics Regulation</u>. Further information about the mapping of WasteDataFlow waste material categories to the statistical waste category can be found in the household waste quality report. For intelligibility, in this document the statistical waste categories "Metallic wastes, ferrous ", "Metallic wastes, non-ferrous", and "Metallic wastes, mixed ferrous and non-ferrous" have been combined into the one category "Metallic wastes", and the statistical waste categories "Mineral waste from construction and demolition" and "Soils" have been combined into one "Construction and soils" category. The <u>Household Waste</u> <u>Discover Data tool</u> retains the original statistical categories.

Release

The release of this publication is in line with release practices specified in the <u>Code of</u> <u>Practice for Statistics</u>. The statistics are released at the standard time of 9.30 am on a preannounced weekday date. Pre-release access to the statistics in their final form is provided to Scottish ministers and those on a list of named officials advising them 5 working days before the public release. This is to ensure that at the time of release Scottish ministers are able to comment publicly on the statistics based on a correct understanding of them.

Glossary of terms

BSI PAS 100 / 110 – a national compost/digestate benchmark that specifies the minimum requirements for the process of composting/anaerobic digestion, the selection of material from which compost/digestate is made, and standards for the compost/digestate product quality. PAS 100 is applicable to composting facilities while PAS 110 is applicable to anaerobic digestion facilities. The use of this standard to improve the quality of compost/digestate in Scotland became Scottish Government policy in 2011, with 2014 being the first year it was applied to the household official statistics.

Carbon Impact – a measure of the whole-life carbon impacts of waste, from resource extraction and manufacturing emissions, right through to waste management emissions, regardless of where in the world these impacts occur. The carbon impact of waste was developed by Zero Waste Scotland (<u>https://www.zerowastescotland.org.uk/content/what-carbon-metric</u>).

Compost like output (CLO) – partially digested waste outputs generated from the biological treatment of residual municipal solid wastes at a process that involves both mechanical and biological treatment. Outputs typically do not conform to composting standards such as PAS 100/110.

Household waste – waste generated by households (see full definition in Paragraph 1.2 of the *Zero Waste Plan - guidance for local authorities* on the <u>WasteDataFlow web site</u>).

Kerbside Collection – A service provided by local authorities to households, of collecting and disposing of household waste and recyclables, which are presented to the authority on the kerb. It includes individual household waste containers, as well as communal bin stores provided to multiple tenants.

Landfill rate – waste landfilled as a percentage of all waste generated. Note that total waste generated does not equal total waste managed due to stockpiled waste, which is counted in the generation figures and will be included in the managed figures in the year it is sent to final management.

Other diversion from landfill – describes the fate of waste material not recycled or landfilled. It includes:

- household waste treated by incineration, including any incinerator bottom ash and metals from bottom ash that are diverted from landfill,
- weight loss that occurs during the composting/digestion of waste to PAS 100/110 and non PAS 100/110 compost/digestate where the output is landfilled,
- CLO that is not landfilled,
- weight loss that occurs during mechanical and biological treatment processes (e.g. production of CLO and RDF),
- from 2014, any waste composted/digested that has not reached the quality standards set by PAS 100/110 and is not landfilled.

Recycling rate – waste recycled as a percentage of all waste generated. Note that total waste generated does not equal total waste managed due to stockpiled waste, which is counted in the generation figures and will be included in the managed figures in the year it is sent to final management.

Refuse derived fuel (RDF) – waste separated from residual municipal solid waste with a calorific value suitable for use as a fuel in combustion processes.

Segregated recyclate – waste materials collected for recycling separately from residual waste collections. This includes collection of single materials as well as co-mingled materials.

TCO2e – tonnes of carbon dioxide equivalent, which is a measure that allows the comparison of greenhouse gases relative to one unit of CO₂.

Waste composted - is waste recycled by biological treatment through composting at a composting plant or through digestion at an anaerobic digestion facility.

Waste generated - is waste collected by or on behalf of local authorities that is managed within the relevant reporting year. This might include treated waste stockpiled prior to final management.

Waste landfilled – includes all household waste that is disposed of at a landfill site instead of being recycled or diverted from landfill through other methods. It also includes incinerator ash that is landfilled, plus any recycling and composting rejects that occur during collection, sorting or further treatment that go to landfill.

Waste managed - includes all wastes recycled, diverted from landfill and landfilled within the relevant reporting year. This includes stockpiled waste from a previous year sent to final management but excludes treated waste stockpiled prior to final management.

Waste recycled - includes recyclable materials that have been recycled or reused and also biodegradable materials that have been composted or digested. The amount of waste recycled, reused and composted is that accepted by the reprocessor facility. As such it excludes any recycling rejects that occur during collection, sorting or further treatment. From 2015, the composting figures using thenew calculation methodology do not include any waste composted that has not reached the quality standards set by PAS 100/110.
